GovNexus

Government schemes and services, connected to you.

SOLUTION PITCH

AI-assisted discovery and guidance for Indian government schemes and services

One searchable place to find a scheme, understand it, prepare for it, and reach the official portal.

THE PROBLEM

Schemes and services sit across many **Central, state, UT and department portals**. Citizens struggle to **discover** relevant schemes, understand **eligibility**, identify **documents**, follow application procedures and find the **correct official portal**. Fragmented information and language barriers make access harder.

OUR SOLUTION

GovNexus is an **AI-assisted discovery and guidance platform**. It aims to bring information from multiple government sources into one searchable experience and help citizens understand schemes, explore eligibility, prepare documents and navigate toward **official application channels**.

KEY FEATURES

Discover

Search and browse government schemes and services with category filters and **Central / state / UT** filtering (28 states, 8 UTs selectable). Detail pages show source, jurisdiction and status.

Ask in your language

AI assistant grounded in reviewed evidence, with a language selector and **voice input/output** via the existing **Prism** integration. Falls back to an explicit "evidence unavailable" reply.

Prepare and apply

Eligibility guidance that compares your answers with source-listed conditions, **document guidance** that separates confirmed from suggested items, a readiness checklist and **citizen-recorded** application tracking.

Trust by design

Source-aware records with registered official sources, pending-review facts, human verification and publication safeguards. **Verification status** is shown; **official portal links** lead the way out.

Current status. Working prototype: FastAPI backend, MySQL schema with migrations, citizen and admin portals, grounded assistant, Prism voice endpoints, and a controlled ingestion and verification workflow. The repository ships **13 demo records** labelled "AI-researched, pending human verification"; the published catalogue is populated only after sources are verified by a reviewer. **Pan-India coverage is the project goal, not a claim of present coverage.**

TECHNOLOGY STACK

FRONTEND	BACKEND	DATABASE	AI	VOICE	PLATFORM
HTML, CSS, Vanilla JavaScript	Python, FastAPI, SQLAlchemy, Alembic	MySQL	Groq (primary), Gemini (fallback)	Prism speech-to-text / text-to-speech	JWT auth, retrieval, source ingestion

IMPACT AND VISION

- Make government information **easier to discover** in one place.
- Reduce confusion around **eligibility** and **application preparation**.
- Improve access through **multilingual assistance** across the 22 Eighth Schedule languages configured in the platform.
- Goal: a unified experience for the **Central Government, all 28 states and all 8 UTs**.
- Help citizens reach the **appropriate official government channels**.

Trust and responsibility. GovNexus uses source-aware information and distinguishes incomplete records from verified information. It does not guarantee scheme eligibility, fabricate government requirements, or submit applications on behalf of citizens. Citizens complete applications through official government portals.
